

HSP Emulator Chassis

For all Nohau ISA card emulators.

Product Description

Nohau emulators are available using ISA cards or in handheld portable form. The PC ISA card emulators support the 8051, 68HC11, 251, 196 and HC16/300 families. These ISA emulation and trace boards can reside in your PC or in the optional emulator chassis shown above.

The HSP chassis is useful for people needing a more mobile emulator or who do not have available ISA slots in their PC. The chassis makes it easy to move the emulator around the lab or to a customer site for local development.

The HSP chassis is available with parallel or USB I/O that provides a fast communication path. The parallel port remains available for since it is a feed-through connector, and communicates via a proprietary protocol developed by Nohau.

The data transfer rate is almost as fast as when the boards are directly installed into your PC motherboard, and the user will not notice any change in performance.

The HSP uses a separate 5 volt regulated power supply that is included with the box. Portable operation is thus possible with AC mains anywhere in the world. The actual power consumption depends on the emulator configuration and speed, and options installed.

Contact Nohau today for the name of your local Nohau representative, and visit the Nohau web site for more information on this chassis or other Nohau development tools.
